

INTRODUCTION

These instructions are in accordance with the standards of the National Building Code of Canada, section 9.27 and are intended to cover the normal building practices encountered in Canada and the United States.

In coastal provinces (NFLD, NS, NB, PEI, BC) CANEXEL SIDINGS MUST BE APPLIED ON FURRING STRIPS ("STRAPPING"). In coastal QC furring strips are highly recommended. We also recommend the use of a humidistat-controlled mechanical ventilation system, as specified in the N.B.C., in conjunction with strapping. This represents good building practice. Strapping is also required by certain manufacturers of breather-type building paper.

In all cases, consult your national and local building codes to ensure appropriate installation.

Installation of the siding over furring strips allows ventilation behind the siding, thus reducing the damage that could occur should there be moisture accumulation in the walls due to exfiltration and infiltration. Automatically controlled mechanical ventilation also greatly reduces the risk of condensation moisture problems occurring in the walls.

Canadian Construction Materials Centre (CCMC) recommends that ALL types of horizontal, vertical, and panel sidings for use on NHA housing in the Atlantic Provinces be installed over furring strips.

IN NON-TRADITIONAL ICF AND SIP ASSEMBLIES, THE ICF OR SIP MANUFACTURER MUST PRESCRIBE THE FASTENING SPECIFICATIONS. NOTE: LP DOES NOT RECOMMEND CANEXEL FOR USE IN THESE NON-TRADITIONAL ASSEMBLIES. IF USED, LP WILL NOT WARRANT FOR BUCKLING AND SHRINKAGE. HOWEVER, BALANCE OF WARRANTY DOES REMAIN INTACT.

At the time of manufacture, CanExel siding meets or exceeds the performance standards set forth in Composite Panel Association ANSI 135.6-2006 and conform to "CAN/CGSB-11.5 M87"

STORAGE

Do not store CanExel Siding in heated buildings. Storage in heated buildings will dry out the siding and make it susceptible to buckling.

The siding must be kept on LP Canada supplied pallets so that it remains flat, and must be covered with a water resistant shroud provided by LP Canada.

Keep siding clean and dry. Inspect prior to application.

Allow siding to adjust to atmospheric conditions before application.

STUD SPACING

CanExel Siding may be installed over sheathing or unsheathed walls (single-skin application) and NAILED INTO STUDS SPACED NOT MORE THAN 16 in. (400 mm) O.C. Use a code approved breathable barrier between the siding and the studs or sheathing. ALLOW AT LEAST 6 in. (152 mm) BETWEEN THE BOTTOM EDGE OF THE SIDING AND THE GROUND. SIDING SHOULD NOT COME IN DIRECT CONTACT WITH CONCRETE. These measures will reduce moisture absorption by the siding.

Siding may be applied over masonry construction as long as furring strips are utilized and securely attached to the masonry assembly on sixteen (16) in. centers.

Studs must be a minimum 1.5 in. x 3.5 in. (38 mm x 89 mm)

MOISTURE

Moisture control and moisture vapor control are critical elements of proper housing design. Check your local building codes for application procedures for handling moisture and moisture vapor in your area.

As with all wood products, do not apply engineered wood siding to a structure having excessive moisture conditions such as drying concrete or plaster. If such conditions exist, the building should be well ventilated to allow it to dry prior to the applications of the siding.

Siding must not be applied to green or crooked structural framing members. Do not apply siding over rain-soaked or buckled sheathing materials.

Gutters are recommended for control of roof water run off.

Dirt or gravel floors in basements or crawl spaces are major sources of moisture. It is therefore essential that such floors be sealed (by a layer of concrete, asphalt, polyethylene, etc.) to minimize the risk of moisture damage to the structure and siding.

New construction produces a lot of moisture as the concrete, lumber and drywall dry out. In colder weather it is recommended that windows be left partially open to dissipate this surge of moisture.

A vapor barrier with a perm rating less than 1 (e.g. polyethylene or foil) must be installed on the WARM SIDE or interior surface of the wall, and extend behind partition walls to form continuous protection of exterior walls. This is necessary to prevent condensation from damaging the components of the wall system. (Note that exterior building paper is not a vapor barrier.)

SECONDARY WEATHER RESISTANT BARRIER

A properly installed breathable water-resistive barrier is required behind the siding. Special care must be taken to completely seal all openings for electrical boxes, conduits, pipes, wiring, and joints or tears in the water-resistive barrier to prevent moisture from entering the wall cavity.

Consult your local building code for details. LP will assume no responsibility for water penetration.

GAPS & SEALANTS

Seal all gaps with a high quality, non-hardening, paintable sealant. Follow the sealant manufacturer's instructions for application.

FLASHING, WINDOWS, DOORS & OPENINGS

All openings must be properly sealed or flashed in a manner that prevents moisture intrusion or buildup. Several examples that accomplish this are shown on the following pages.

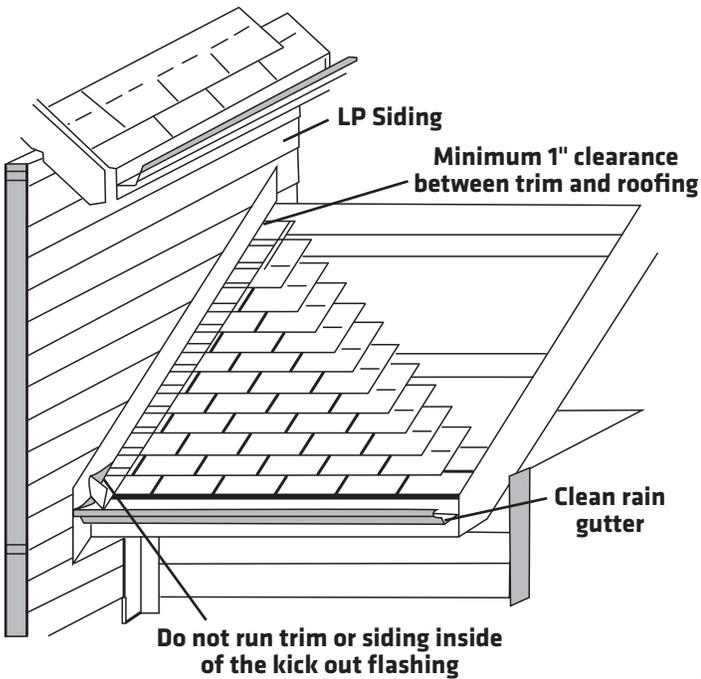

Siding applied adjacent to porches, patios, walks, etc. must have a clearance of at least 1" above any surface. The surface must be sloped or otherwise designed to provide proper drainage so the siding is at no time directly exposed to standing water.

Space nails 8 in. (200 mm) O.C. along edge of siding under windows: shim where necessary. DO NOT FORCE OR SPRING SIDING INTO PLACE as this will cause buckling.

ALWAYS LEAVE A 3/16 in. (4 mm) SPACE WHEREVER SIDING BUTTS AGAINST TRIM OR OTHER MATERIALS to allow for expansion. Use J-mould or sealant.

KICK-OUT FLASHING

- Install kick-out flashing to direct the water into the gutter
- Install step flashing with minimum 4-inch upper leg
- Properly integrate flashing with the secondary water-resistive barrier. Use housewrap, flashing tape, z-flashing, or other items as needed to maintain the counterflashing principle.
- DO NOT extend the siding or trim into the kick-out flashing or gutter
- Maintain a clearance between the end of the gutter and the adjoining wall to allow for proper maintenance of the siding
- Paint ALL exposed cut edges

FURRING STRIPS (STRAPPING)

See detailed installation Instructions. Furring strip use will vary with the various orientations of the siding (horizontal, vertical or diagonal)

RE-SIDING OF EXISTING BUILDINGS

The new siding MUST be installed on furring strips (strapping) after the weather resistive barrier (building paper or housewrap) has been replaced. The old siding must be removed. If necessary, shims should be used to "true up" the furring.

INSULATED SHEATHINGS

LP CanExel Siding may be installed over low-compression rigid foam or fiberglass sheath-ings. The following precautions must be followed:

- Adequate bracing of the wall in accordance with the National Building Code or other ruling building code is required.
- For rigid foam sheathing up to 1" (25.4 mm) thick, siding may be nailed directly to the foam sheathing unless a drainage plane is required by the local building code. Nail length must be in-creased to ensure a minimum 1-1/4" fastener penetration into the structural framing.

- For rigid foam sheathing greater than 1" (25.4 mm) or for fiberglass sheathings, a minimum 1-1/4" (31.75 mm) thick by 4" (101.6 mm) wide strapping must be installed over the sheathing to provide a solid, level nailing base for the siding. The strapping must be securely fastened to structural framing spaced no greater than 16" OC (406 mm) with a minimum nail penetration of 1-1/4 inches (31.75 mm) and a maximum nail spacing no greater than the width of the siding.

Louisiana-Pacific Canada will assume no responsibility for any damage or condition arising from the use of foam sheathing.

NAILS/FASTENING

Maintain a minimum 1.25 in. fastener penetration into the stud, strapping, or combination thereof

- Nailable sheathing may be included in the penetration requirement
- 1.125 in. minimum stud penetration for spiral shank

Increase nail penetration if code requires.

Blind nailing is required except around windows and other wall openings.

Use corrosion-resistant nails with a minimum 0.113 in. diameter shank and a 0.240 in. head

Fasten along the nail-line no greater than 16" OC

DO NOT USE STAPLES!

CONDITION

Snug

CORRECTION

OK

Flush

OK

Visible fiber

Paint

Countersunk $1/16$ in. - $1/8$ in.

Seal with caulking

Countersunk more than $1/8$ in.

Seal with caulk and re nail

TRIM

Trim should be thick enough so the siding does not extend beyond the face of the trim.

Trim and fascia must be applied in a manner that will not allow moisture intrusion or water buildup.

ACCESSORIES

A complete range of accessories are available from LP including:

- Metal starter strips
- Color-matched mouldings for joints, inside and outside corners, J-mouldings, drip caps and Z flashings
- Color-matched touch-up paint or stain
- Color-coordinated caulk/sealant

SIDING APPLICATOR INSTRUCTIONS

Ridgewood D-5 may be applied horizontally or diagonally. Ultraplank may be applied vertically or diagonally. Ultraplank must not be installed horizontally. Slightly different techniques for proper application are required for each type of use. Be sure to note the correct method for each type of installation.

1. HORIZONTAL APPLICATION: RIDGEWOOD D-5

Level and install metal starter strips along bottom edge of sheathing or sill plate, or up to 1 in. (25mm) below these, as required by course layout. Install first course of siding so that the machined groove on the lower back of the siding fits over the edge of the starter strip. Fasten the siding by nailing into the nailing line (about 1/2 in. (12mm) from the top edge of siding) at each stud or furring strip located over the stud, leave no more than 16 in. (400mm) between nails.

Install subsequent courses of siding so that the machined lower edge on the back of the siding fits over the top edge of the previously installed piece of siding.

When furring strips are required they must be installed vertically and must be nailed into wall studs, 16 in. (400mm) O.C. over the full height of the wall. Furring strips must not be less than 1/4 in. (6mm) thick and nail penetration into the stud a minimum of 1.25 inches.

To ensure ventilation, both the top and bottom of the space between furring strips must be left open. At the top this gap can be behind the soffit. In walls that are vented to the soffit, soffit must be vented to allow air flow. The opening at the bottom should be open to the outside except for the insect screen. Under and above windows and above doors maintain spacing of 2 in. between furring strip and horizontal framing (see diagram). At the bottom, a short furring strip about 12 in. (300mm) long should be installed vertically centered between each main furring strip. This will provide better support and will ensure that the insect screen fills the opening.

2. VERTICAL APPLICATION: ULTRAPLANK

Vertical application must be made over horizontal furring strips spaced not more than 16 in. (400mm) O.C. Furring strips must be a minimum of 1 in. (actual) (25 mm) thick and nailed directly into the framing or combined structural wood sheathing and framing.

To ensure ventilation when applying siding vertically the horizontal furring strips must have periodic spacing at abutments (see diagram).

When siding is installed vertically the lower end of the laps must be protected from the elements.

This can be done by coating the exposed ends with the appropriate CanExel touch-up paint or stain. (see steps 4 & 5 for more details)

3. DIAGONAL APPLICATION: RIDGEWOOD D-5 AND ULTRAPLANK

Diagonal application must be made over horizontal or diagonal furring strips. Nail spacing should not exceed 16 in. (400mm). Furring should be spaced 12 in. O.C. (300mm) and securely nailed into the structural framing. Furring strips must be a minimum of 1 in. (actual) (25mm) thick and nailed securely into the combined structural wood sheathing and framing.

When siding is installed diagonally the lower end of the laps must be protected from the elements.

This can be done by coating the exposed ends with the appropriate CanExel touch-up paint or stain. (see steps 4 & 5 for more details)

4. JOINT TREATMENT

The vertical joint between adjacent siding pieces must be located over the middle of a stud or furring strip that is also located over a stud. Leave a 3/16 in. (5 mm) gap between siding pieces and nail into the stud or furring strip. Nail on each side at the top nailing line. For Ridgewood D-5, insert a joint moulding into the gap or seal. For Ridgewood D-5 used in diagonal applications, a sealant must be used in the 3/16 in. joint. All Ultraplank joints must be sealed with a high quality paintable non-hardening sealant. Use special care to not overlap sealant onto the painted surface. Stagger joints from one course to the next.

5. TWO STORY OR MORE WALLS (New Construction Only)

Where siding is applied vertically or diagonally on walls two stories or more, cut the siding at each floor line leaving a 3/16 in. (5 mm) gap between the bottom and top pieces. Finish the gap by sealing the gap with a high quality paintable non-hardening sealant. If a horizontal band or trim separates the siding between floors, install a Z flashing and seal the end of the siding with the Canexel touch up paint.

6. CORNER TREATMENT

Siding should be butted to inside and outside corners leaving a 3/16 in. (5 mm) gap. When Canexel inside and outside corners are used they should be applied BEFORE the siding; if not, wood trim should be applied over the siding after its installation.

7. TOUCH-UPS

Color-matched touch-up paint can be used to repair small scratches and chips that may occur during installation. Dab the touch-up with a Q-tip or point of a cloth to soak in to the raw surface, do not brush or rub.

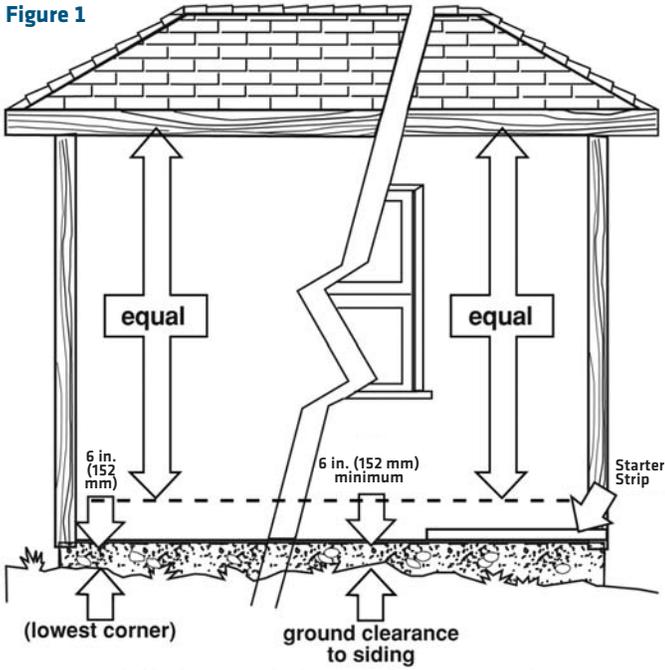

CARE OF CANEXEL PREFINISHED SIDING

All Canexel Siding finishes are long wearing and require little maintenance. For best results, siding must be washed annually using non-abrasive household cleaners according to the manufacturer's recommendations. Test cleaners on a small area to ensure they do not damage the finish. Rinse siding surface thoroughly after cleaning. DO NOT USE PRESSURE WASHER.

For further product information in the US and Canada, please call Customer Support at 888-822-8899 or write to: LP Corporation, 414 Union Street Suite 2000, Nashville, TN 37219
